Experience

Wisflux Tech Labs, Jaipur

July 2024 – Present

Full Stack Developer (Backend Focus)

- Developed and maintained production features for **GSA Inc.**, a Massachusetts-based U.S. client, delivering scalable backend solutions tailored to their operational workflows.
- Designed and implemented a real-time collaboration system using NestJS and Socket.IO with Redis Pub/Sub, enabling concurrent editing, user presence tracking, live data synchronization, and room-based broadcasting across distributed clients.
- Implemented distributed locking using Redis with heartbeat-based lock extension, preventing concurrent execution of critical workflows across services.
- Designed an event-driven data pipeline and asynchronous audit logging system using PostgreSQL triggers, Kafka, and Google BigQuery, ensuring zero transactional latency impact and near real-time analytics.
- Implemented fault-tolerant pipelines using retry mechanisms, circuit breakers, and Dead Letter Queues (DLQ) to ensure reliability and data consistency.
- Built full-stack features for reviewing and correcting LLM-extracted data, improving accuracy in AI-driven bid processing workflows.
- Optimized REST API performance by redesigning data-fetching strategies, implementing indexed queries, summary endpoints, and lazy loading, reducing payload size from 1.4MB to 10KB and improving response times by 50–90%.
- Built a high-performance Project Metrics API using NestJS and Sequelize, replacing client-side aggregations with optimized SQL queries (SUM, CASE, ARRAY_AGG), reducing payload size by 95% and eliminating UI thread blocking.

Wisflux Tech Labs, Jaipur

April 2024 – July 2024

Software Development Intern (Full Stack)

- Contributed to **Kira**, a browser-based SPA for hospitality project management, improving team transparency through end-to-end feature development.
- Built and enhanced production features across Angular, NestJS, and PostgreSQL, resolving bugs and strengthening full-stack proficiency in an agile environment.

Projects

Collaborative Task Board (Real-Time Kanban)

- Tech Stack:** TypeScript, Angular, NestJS, PostgreSQL, TypeORM, Supabase Auth, Socket.IO, Redis, Docker
- Built a Trello-style workspace: projects, boards, columns, and tasks with relational schema, TypeORM migrations, and JWT auth via Supabase.
- Implemented real-time updates and presence with Socket.IO (per-board rooms) so multiple users see changes as they happen.
- Added Redis-backed per-task edit locks (TTL, atomic unlock/renew) with REST enforcement so concurrent edits are handled safely.
- Delivered drag-and-drop Kanban UX with server-side ordering/transactions for moves across columns.
- Containerized API and Redis with Docker Compose for consistent local and deployable environments.

Technical Skills

Backend: Node.js, NestJS, Express.js **Frontend:** Angular **Databases:** PostgreSQL
Messaging: Kafka, Redis (Pub/Sub) **Real-Time:** WebSockets, Socket.IO, SSE
Languages: TypeScript, JavaScript, SQL, **Concepts:** REST APIs, Microservices
Tools: Git, , Cursor, VS Code, Claude Code

Education

Swami Keshvanand Institute of Technology, M&G, Jaipur

2020 - 2024

B.Tech - Information Technology

CGPA: 8.4
